

Project Overview

STAR is a Chrome browser extension built during my AWS internship to improve a manual partner-engagement process through thoughtful AI implementation using Amazon Bedrock and other AWS services. It was initially designed around the Co-Sell outreach workflow, where users had to review partner data files, cross-reference account-mapping information, identify the right stakeholders, and draft tailored outreach.

What began as a solution for one time-intensive workflow evolved into a unified automation tool with the potential to support additional manual processes through the same interface, demonstrating extensible design and long-term scalability.

Project Impact

97%

time savings: reduced outreach prep from 5-10 hours to about 15 minutes per partner

<2 min

to complete stakeholder prioritization

10-100

personalized emails generated in a single batch

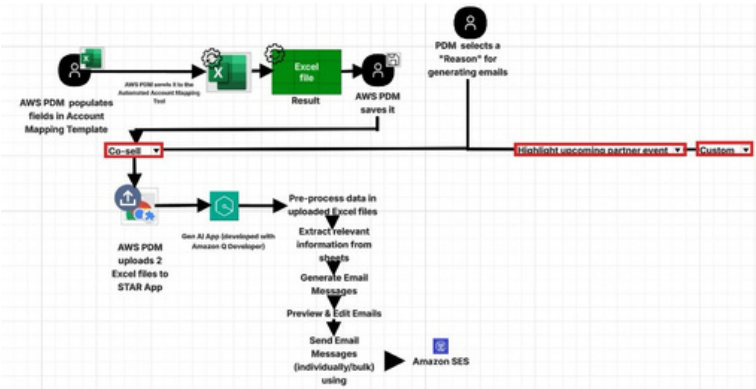

33+

stakeholder contributors engaged during feedback and validation

How STAR Works

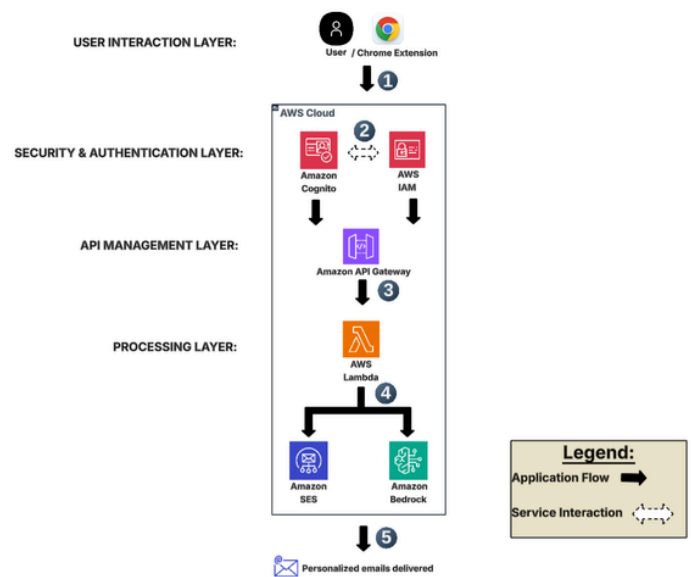

1. User selects a configured workflow in the STAR browser extension
2. STAR presents the required inputs and processes the information
3. User reviews, edits, and sends the generated output via interface

Co-Sell Use Case Workflow

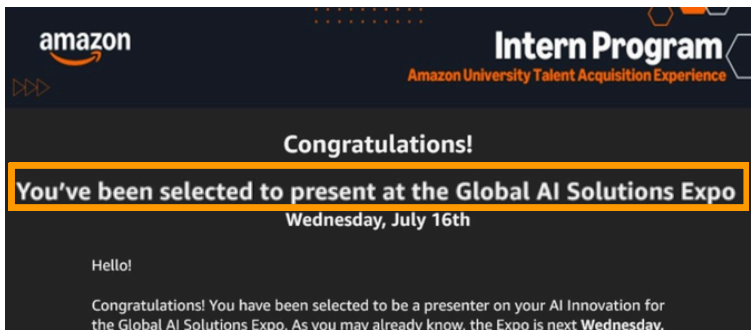

Shows how STAR simplified a multi-step Co-Sell outreach process into a more efficient AI-assisted workflow.

STAR High-Level AWS Architecture

High-level view of the AWS services supporting secure access, workflow orchestration, content generation, and email delivery.

2025 AWS Global AI Solutions Expo Selection

Selected presenter at the 2025 AWS Global AI Solutions Expo, recognizing STAR's innovation and business impact.
